

## Draft of a regulation for aeronautical data

2004 - 2005

### Problem:

Aeronautical data are necessary for planning and execution of flight operations. This data must be collected and provided in a framework of international agreements as a sovereign task. In the process chain from collection and processing, over administration and validating up to publication and usage of aviation data different private and public authorities are involved. The tasks and the responsibilities of the involved parties must be adhere in a new data regulation. This data regulation is also the basis for assignments for achievement, accreditations, liability regulation etc.

### Services:

In several workshops with the involved parties (FOCA, skyguide, ... ), moderated by ITV, the contents of the regulation are discussed and requirements gathered.

Based on the results of these workshops and the standards of the Swiss federation ITV compiled a draft for the regulation text and doing so brings in the experiences of the national adjustment of spatial data.

### Benefit:

FOCA receives a draft of a national regulation for aeronautical data including a catalog for aeronautical data.
