

Realisation of a geographical information system (FLUGIS) at Zurich Airport

2004 - 2005

Problem:

In the context of the concept for a geographical information system (GIS), also provided by ITV, a new GIS at the airport Zurich (FLUGIS) is to be realised. The new GIS is to be introduced at different user groups into the daily processes.

Services:

ITV accompanied the evaluation team of Unique during the public tender for the future geographical information system. The task of ITV was the establishment of the tender documentation (product requirement specifications, specifications of services, criteria catalogue and evaluation model) and the attendance of the system tests (allocation of tasks).

After conclusion of the evaluation, ITV supported the lawyer of Unique in the extensive agreement negotiation with the system supplier.

For the system acceptance, ITV arranged the test scripts and check lists.

Benefit:

Final introduction and realisation of FLUGIS including system acceptance and signed contracts.
